N-GOOO NP 12-28

DOSE/HECTARE*

200-500 kg

NITROGEN COMPOUND FERTILIZERS WITH DCD NITRIFICATION INHIBITOR OBTAINED BY PHYSICAL COMPACTION

The N-GOOO LINE is the range of slow-release granular nitrogen fertilizers, containing the nitrification inhibitor Dicyandiamide (DCD). The presence of DCD, which inhibits the activity of the Nitrosomonas bacteria responsible for the nitrification process, allows the gradual trasnformation of ammoniacal nitrogen, absorbed by soil colloids and non-washable into the nitric form, highly washable, in a period of time between 60 and 90 days. Throughout this period, nitrogen is made available to the plants gradually, reducing losses both by leaching into the soil and by volatilization in the atmosphere. This allows a dose reduction of up to 20% in fertilizing units, compared to traditional formulations. The granular formulation of these fertilizers is obtained through compaction, a dry granulation process borrowed from the pharmaceutical industry that uses mechanical compression to agglomerate the particles of the raw materials. This allows for granules to be obtained without adding solvents, which can have a negative impact on the final solubility of the product. The granule obtained by compaction is characterized by easy and fast disintegration, ensuring a rapid assimilation of nutrients by the roots.

The efficacy of the product is also improved by the particular production process in which DCD in the microcrystalline state is mixed with the other raw materials (Nitrogen, Phosphorus, Potassium) and everything is subsequently compacted. This allows to ensure the uniform distribution of the inhibitor in the granule, improving its effectiveness and efficiency both in nutritional and environmental terms.

N-GOOO NP 12-28 is a binary fertilizer (NP) of the N-GOOO LINE recommended for basic fertilizations. It is recommended for pre-sowing fertilizations of cereal crops, at planting and production phase of fruit crops and vineyards, and localized on beets, especially in soils rich in assimilable potassium.

TIME OF APPLICATION

20.00%

Fruit crops e Horticultural crops e Cereal crops	Pre-transplanting/sowing fertilization, Post-transplanting/sowing fertilization		
COMPOSITION		PHYSICO-CHEM	NICAL FEAT
Total nitrogen (N)	12.00%	GRANULAR	
Ammoniacal nitrogen (N)	3.50%		iiiii t
Ureic nitrogen (N)	8.50%	METHOD OF	<u>OJ:</u> 🔻
Nitrogen inhibitor Dicyandiamide (DCD)	2.50%	USE	Cove
Inhibitor content as a mass percentage of the total nitrogen	2.50%		fertiliza
Phosphoric anhydride (P ₂ O ₅) total	28.00%	PACKAGING: 25 KG -	
Phosphoric anhydride (P ₂ O ₅) soluble in water	6.50%		
Phosphoric anhydride (P_2O_5) soluble in neutral ammonium citrate and in water	8.00%
